Profit factor High, Jan 2023 – Nov 2026	Months closed in profit	Trades a week on average	Max drawdown High tier

THE PHILOSOPHY

The craftsman's hand

Takumi (匠) is the Japanese word for a master craftsman: someone who has repeated the work long enough to know exactly when to act and when to leave it alone.

One way of trading never suits the market all the time. So Takumi runs four engines side by side on EURUSD, each looking for a different kind of opportunity. When conditions don't suit one, another is usually working.

They trade in baskets: a small first position, built on carefully if the market moves away, and closed together when the basket reaches its target. Most baskets are open for a few hours. The result is steady activity through the day and night, and an account carried by whichever engines the market currently favours.

Built for

- **Traders who like activity.** Around 60 trades a week, 24 hours a day, five days a week.
- **Smaller accounts.** You can start from $2,000.
- **People who want control.** Eight risk levels, and compounding on or off.

Not built for

- **Anyone who needs a stop loss on every trade.** Takumi holds baskets through moves against it; see why there are dips.
- **Anyone who can't watch a floating loss.** Open positions are often in the red while a basket works.
- **Money you can't afford to have at risk.** Leveraged trading carries real risk.

> **The CODU family**
>
> Our gold systems trade short bursts or single breakouts. Takumi is the currency system: one pair, four engines, working steadily around the clock.

HOW IT WORKS FOR YOU

Steady, around the clock, yours to size

You don't need to read a chart. This is what Takumi does every day.

Four engines, one system

Four independent engines run on the same EURUSD chart. Each looks for a different kind of opportunity, so they are rarely all busy at once.

Around the clock

Takumi trades all 24 hours, Monday to Friday. There is no session to wait for and nothing to switch on in the morning.

Baskets close together

Each engine builds a basket and closes every position in it at once, when the basket as a whole reaches its target.

Knows when to step aside

When its own signals say the market has turned against a basket, Takumi can close it at a contained loss instead of holding on and adding.

Grows with your account

With compounding on, lot size is re-worked from your balance once a day, so the system grows as you do.

Eight risk levels

From Very Low to Extreme. Same trades at every level; only the size changes. Pick the level that matches your account and your nerve.

Picks up where it left off

If your terminal or VPS restarts while baskets are open, Takumi finds them again and carries on managing them.

Three settings

Your licence key, your risk level, and compounding on or off. Everything else is fixed at the tested values.

PERFORMANCE

Four years on real tick data

The High level, run from January 2023 to November 2026 with compounding on. $10,000 start, nothing withdrawn.

Return by year, High

* Part year. Returns compound: lots grow with the balance, so each year starts from a larger account. $10,000 became $180,733. StarTrader real ticks, Takumi client build on its default settings.

How often it trades

12,249	~60	5,741	68.5%
Trades over the test	Trades a week on average	Baskets closed	Winning trades

Trade count is identical at every risk level; only the size changes.

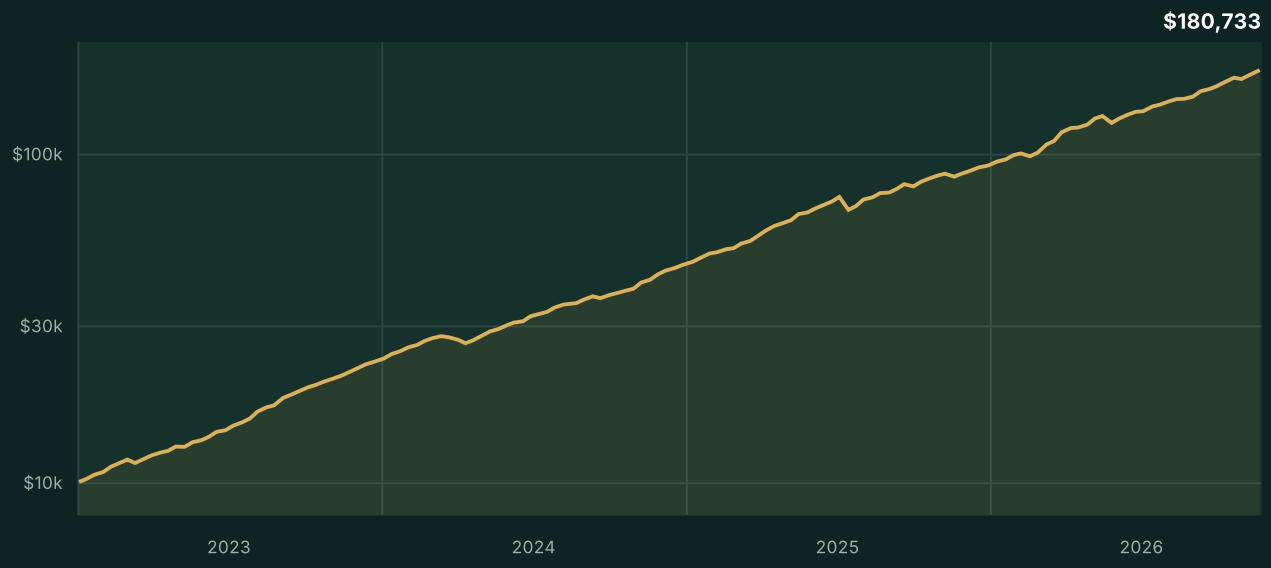
Checked on the broker our clients use

On JT Markets data from January to early September 2026, High grew $3,000 to **$5,828**, with every month closed in profit.

THE EQUITY CURVE

Every closed basket, four years

High, $10,000 start, nothing withdrawn. The scale is logarithmic, so equal heights mean equal percentage growth and the early years stay visible.



Balance after closed baskets, StarTrader real ticks, 2 Jan 2023 – 20 Nov 2026. The curve shows closed results; open positions can sit in drawdown between closes (see the next page).

How we tested it

- **Real tick data, not modelled prices.** Every run uses the broker's recorded ticks, the strictest mode in the MT5 Strategy Tester.
- **Two brokers.** Nearly four years on StarTrader, and 2026 on JT Markets, where most of our clients trade.
- **Different start dates.** We started fresh accounts on every Monday across the test period, to check the result doesn't depend on a lucky start.
- **Different account sizes.** $2,000, $3,000, $5,000 and $10,000, because lot sizes come in steps and small accounts behave differently.
- **The exact client build,** on the default settings you receive.

What a dip is, and why it happens

Takumi does not put a stop loss on each trade. That is why most baskets close in profit, and it is also why your account will show dips. There are three kinds.

16.7%	-1.3%	1 in 34	10 days
Worst drawdown on High, against the balance at the time	Worst calendar month on High	Baskets closed at a loss over four years	Longest any position was held

1. Equity below balance

While a basket is open and the market is moving against it, the open positions show a loss. Your equity drops below your balance. When the basket closes on target, the two come back together. This is the dip you will see most often, and it is the system working normally.

2. Red trades inside a winning basket

A basket closes all its positions at once. The earliest ones are usually at a worse price than the later ones, so some lines in your history close red even though the basket as a whole made money.

3. A basket closed at a loss

Sometimes the market turns properly against a basket. Takumi can then close the whole basket and take the loss, instead of holding on and adding to it. Your balance steps down slightly. Over four years this was about 1 basket in 34, and the baskets that closed in profit outweighed them many times over.

What protects you

Four engines that struggle at different times, limits on how far each basket can build, and a risk level you choose. Pick one whose drawdown you could sit through without switching it off.

> **The tested drawdown is not a ceiling**
>
> A strong one-way move in EURUSD with no pullback is the hardest condition for this kind of system. A dip larger than any figure in this brochure is possible, and it grows with the risk level you choose.

Account requirements

Platform	MetaTrader 5 desktop (mobile and web versions can't run EAs)
Instrument and chart	EURUSD, one chart
Account type	Hedging (netting accounts won't work)
Leverage	Tested at 1:500; lower leverage means less margin headroom
Minimum balance	$2,000
VPS	Strongly recommended, so baskets are managed around the clock

RISK LEVELS

Pick your level

Same trades at every level. Only the size changes. Lots scale with your balance: 0.01 lot per engine for every $X in the account.

LEVEL	0.01 LOT PER	ON $3,000	STARTRADER JAN 2023 – NOV 2026 FROM $10,000	WORST DD	JT MARKETS JAN – SEP 2026 FROM $3,000	MAX DD
Extreme	$1,000	0.03	$3,445,800*	35%	$10,299	20.2%
Extreme High	$1,500	0.02	$499,000	23%	$6,815	10.5%
High	**$2,000**	**0.02**	**$180,733**	**17%**	**$5,828**	**10.5%**
Medium High	$2,500	0.01	$104,000	15%	$4,799	5.6%
Medium	$3,000	0.01	$70,700	13%	$4,276	5.6%
Medium Low	$3,500	0.01	$53,300	11%	$4,276	5.6%
Low	$4,000	0.01	$43,800	10%	$4,276	5.6%
Very Low	$5,000	0.01	$31,444	7%	$4,276	5.6%

End balance with compounding on, nothing withdrawn, real tick data. * Extreme reaches very large lot sizes late in the test, so its total overstates what is achievable. On a $3,000 account Medium to Very Low all trade the 0.01 minimum lot, which is why their JT Markets results are the same.

Small accounts

The smallest lot a broker accepts is 0.01. On **$2,000** the lowest real level is High; lower levels still trade 0.01 and carry High's drawdown. The levels separate fully from about $5,000. The on-chart panel tells you when this applies.

A worked example

On a **$6,000** account at Medium, each engine trades 0.02 lots. At $9,000 it moves to 0.03 on its own. Nothing to adjust.

Up and running in minutes

What you need

- **MetaTrader 5** with a **hedging** EURUSD account.
- **$2,000 minimum** balance.
- **A VPS,** so baskets are opened, managed and closed 24/5.
- **An account to itself.** No manual trades or other systems alongside it.

What you get

- **Takumi EA** with your personal licence key.
- **Step-by-step setup manual** with screenshots.
- **An on-chart panel** showing your level, lot size, open baskets and today's result.
- **Access to the CODU Discord** for support and updates.

Four steps

1. **Buy and receive your files.** Your download and licence key arrive after checkout.
2. **Copy Takumi into MetaTrader 5** and attach it to one EURUSD chart.
3. **Enter your licence key, choose your risk level,** and set compounding on or off. Everything else is fixed at the tested values.
4. **Leave it to run.** It manages every basket from open to close.

> **Don't close trades by hand**
>
> Closing positions while a basket is still working turns a floating loss into a real one and removes the trades the system was relying on to finish the basket.

Before you buy

Does Takumi use a stop loss?

Not on each trade. It manages baskets to a profit target, and can close a basket at a loss when the market turns against it. Drawdowns are part of the system.

Why did a trade close in the red?

Either it was part of a basket that closed in profit overall, or Takumi closed that basket to limit a loss. Both are explained on the dips page.

Which risk level should I choose?

One whose drawdown you could watch without switching it off. On $2,000 that means High, the lowest level that balance can run.

Should I turn compounding on?

It is on by default. It grows the lot size with your balance. With it off, the lot size stays where it started.

Will my results match the backtest?

Close, not identical. Spread, commission and execution differ between brokers and over time.

Honest notes

- **No stop on each trade means a bad stretch can be a big one.** An extreme one-way move can cause a loss larger than anything in the tests.
- **Drawdowns are real.** The worst stretch on High was 16.7% of the balance at the time. Size your account so you can sit through more than that.
- **The big totals come from compounding.** Lots grow with the balance, so later years carry most of the dollar profit.
- **Higher levels raise drawdown as fast as return.** Extreme is the same system with more of your account exposed.
- **Past performance is not a guide to future results.** No figure here is a guarantee.

Risk warning. Trading leveraged products such as currency CFDs carries a high level of risk and may not be suitable for everyone. You can lose more than your deposit. Results shown are from backtests on historical tick data and are hypothetical; they do not reflect live trading and are not a guarantee of future performance. Takumi is a software tool, not financial advice. Only trade with money you can afford to lose. CODU is a trading name of Jardor Group FZC.
